**Thermal Design
Manual - Sharif**

A cooling tower is a heat rejection device that rejects waste heat to the atmosphere through the cooling of a water stream to a lower temperature.

Cooling towers may either use the evaporation of water to remove process heat and cool the working fluid to near the wet-bulb air temperature or, in the case of

cooling towers were built in the last 1920s in Liverpool, England to cool water used at a electrical power station that used coal), The world's tallest cooling tower is the 200 metres tall cooling tower of Niederaussem Power Station.

Mechanical ones are short in size. A typical one is shown below:

The top of cooling towers widens because this is the point where hot air from inside the tower diffuses and mixes with the atmospheric air.

Therefore, we want to maximize the area through which this diffusion takes place, so that more hot vapor is quickly mixed and the entire process of cooling is done more efficiently.
