Isolation and screening of invertase producing organisms The samples were collected from Gandhinagar Gujarat, India used for isolation of invertase producing yeast. Appropriate dilution of the samples were plated on GYE agar plates and incubated at 30 °C for 72 hours. Total 16 Organisms were isolated in pure form.

PCR was used to isolate an invertase homolog gene from the fission yeast *Schizosaccharomyces pombe*. The cloned *inv1(+)* gene encodes a protein of 581 amino acids with 16 potential asparagine-linked glycosylation sites, and has 39% and 38% identity to the *Schwanniomyces occidentalis* and *Saccharomyces cerevisiae* SUC2 invertases.

A sequence of exercises for the isolation and characterization of invertase (E.C. 3.1.2.26) from baker's yeast obtained from a local grocery store is outlined. Because the enzyme is colorless, the use of colored markers and the sequence of purification steps are designed to "visualize" the process by which a colorless protein is selectively detected and isolated from a mixture of many different proteins.
