A photon with definite helicity induces a transition that flips the direction of spin and, through spin-momentum locking, creates a particle-hole pair that carries a net current. Hosur (15) showed...

Once the graviton couplings to spin-0, 1/2, 1, and 3/2 particles are given, we exhibit the reach of this method by evaluating, as an example, the helicity amplitudes for the process electron + positron → photon + graviton in a very straightforward way.

By using covariant helicity representationsfor the spinor and vector wave functions we obtainthe helicity amplitudes directly from the Feynman loop diagrams by covariant contraction. The necessary loop integra- tions are considerablysimplifiedsince one encounters only scalar loop integrals after contrac- tion.

The helicity formalism leads to simpler intensity and polarization formula over the conventional method in the study of scattering and reaction of particles. The advantages of using the helicity states are many. 1. There is no need to separate the total angular momentum J into orbital

We present the helicity amplitudes for the unequal mass single photon reaction  $pp^* \rightarrow l+l^*$ —in the schannel including the lepton mass. The relative signs of these amplitudes are determined using simple invariance properties.

Therefore, in a parity-invariant theory like QED you have to include both the  $+\$1\$$  and  $-\$1\$$  helicity photon fields. The representations do not have to be irreducible, so no one can stop us from thinking about a photon field with two polarizations. Reference [Weinberg] Weinberg, S.

4. Conclusion. The difference of the cross-sections of heavy quark pair production for parallel and perpendicular polarized photon collisions is suppressed by factor  $m/Q^2$  /s.We show that the QCD correction for the  $b\bar{b}^*$  production asymmetry is less than 1% in the whole energy range of the PLC and practically does not change the background for the measurement of CP parity of Higgs boson.

The photon is a type of elementary particle.It is the quantum of the electromagnetic field including electromagnetic radiation such as light and radio waves, and the force carrier for the electromagnetic force.Photons are massless, and they always move at the speed of light in vacuum, 299 792 458 m/s.. Like all elementary particles, photons are currently best explained by quantum mechanics and ...
